Use the number of protons, neutrons, and electrons to draw a model of the atom, identify the element, and determine the mass and charge. Predict how addition or subtraction of a proton, neutron, or electron will change the element, the charge, and the mass. Use the element name, mass, and charge to ...

Ions are ubiquitous in nature and are responsible for diverse phenomena from the luminescence of the Sun to the existence of the Earth's ionosphere. Atoms in their ionic state may have a different colour from neutral atoms, and thus light absorption by metal ions gives the colour of gemstones. In both inorganic and organic chemistry (including biochemistry), the interaction of water and ions is ...

The electron is a subatomic particle, symbol e^- or $\hat{1}^-$, whose electric charge is negative one elementary charge. Electrons belong to the first generation of the lepton particle family, and are generally thought to be elementary particles because they have no known components or substructure. The electron has a mass that is approximately 1/1836 that of the proton.

Patterns for Polyatomic Oxyanions. Notice how the four polyatomic-ate ions in the center square (phosphate, arsenate, sulfate, and selenate) all have four oxygen atoms, while the polyatomic -ate ions on the outside all have three oxygen atoms.; As you start from right-hand side, the first column of polyatomic -ate ions (chlorate, bromate, iodate) all have a 1- charge.

An ion is an electrically charged atom or group of atoms. It is a part of an atom, or part of a group of atoms (). It is "charged" so it will move near electricity. This is because atoms are made of three smaller parts: neutrons (with no charge); equal numbers of charged protons and; oppositely-charged electrons.; An ion has unequal numbers of protons and electrons.
