Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.

A statistic (singular) or sample statistic is a single measure of some attribute of a sample (e.g. its arithmetic mean value). It is calculated by applying a function (statistical algorithm) to the values of the items of the sample, which are known together as a set of data.. More formally, statistical theory defines a statistic as a function of a sample where the function itself is ...

1. Introduction. This document provides guidance on statistical aspects of the design and analysis of clinical trials for medical devices that use Bayesian statistical methods.

Guidance for the Use of Bayesian Statistics in Medical

Gaussian Processes and Kernel Methods Gaussian processes are non-parametric distributions useful for doing Bayesian inference and learning on unknown functions. They can be used for non-linear regression, time-series modelling, classification, and many other problems.

Researchers typically express the confidence in their data in terms of p-value: the probability that a perceived

result is actually the result of random variation. The value of p (for "probability") is a way of measuring the extent to which a data set provides evidence against a so-called null hypothesis. By convention, a p -value below 0.05 is considered a meaningful refutation of the null ...
