Despite the potential advantages of using satellite remote sensing for monitoring uranium mining and milling, a systematic evaluation of the utility of satellite remote sensing in differentiating uranium mining and milling from other types of mineral mining and milling has not been performed. Previous studies on using remote sensing for monitoring

uranium compounds. The uranium materials associate with the petroleum and natural gas containing rocks. These hydrocarbon accumulations contain the gases from the radioactive decay process. In theory, these gases should rise through the overlying rock and soil system and give radioactive "hot spots" in a halo or fan-shape.
